

Realistic G27 Settings With Force Feedback

Posted by Timeless - 20 Aug 2013 22:35

Can anyone please share realistic g27 and city car driving settings?

Also is it realistic to have centering enabled if I have force feedback on? if so how much should i adjust each bar? and what about the in-game steering linearity and force feedback scale?

Here's a bag of potatoes as a thank you:

Look at my thread I made. Should give you some extra help with whatever you need.

The CCD does not support force feedback unfortunately. I just set in-game force feedback to minimum and disabled centering spring in the Logitech profiler for my G27 .

The CCG does not support force feedback unfortunately.
 However, it is possible to use a force feedback wheel with a spring in the center for a more realistic feel.
